

Hello everybody,

Today we're going to show you some ideas we had to improve our school's external spaces.

We researched the topics of sustainability and social integration and found out some interesting projects around the world which we'll now show to you.

The first idea is inspired by Bali's Green School.

A park could be built in the back of our school, developed to embody sustainability and environmental awareness. The implementation of this concept involves designing classrooms and open-air learning spaces using natural materials and renewable energy sources. Such an environment not only supports academic growth but also gives students a sense of responsibility towards the planet.

Incorporating an outdoor fitness area aligns with the goal of promoting physical well-being within the school community. Companies like NOORD specialize in creating aesthetic, weatherproof and functional outdoor fitness equipment. Their designs are tailor-made for minimal maintenance and can be customized in various colors to complete the school's aesthetic. The integration of such equipment encourages regular physical activity, promotes social interaction and improves the overall attractiveness of the school park.

In front of the school a library with an annexed bar and a table game room could be also built so that the students can meet up with each other and socialize but also to study and confront themselves with the teachers if they need to.

Thank you for your attention. (←ALRIGHT BRO, TOGETHER NOW!)
